

90-Day Roadmap to Launch

From prototype to live product with real users

This roadmap gives you a clear, week-by-week path from your current working prototype to a live, publicly accessible version of KnowMe with real users. The plan is designed to be achievable solo, with minimal budget, using modern tools that match your technical background.

TIMELINE 90 days

BUDGET \$500 – \$2,000

GOAL 50–100 real users

Phase 1 — Foundation (Days 1–30)

Goal: get the tech stack in place and a private version live that you can test yourself.

Week 1	Environment setup	Install VS Code, Node.js, and Git. Create a GitHub account and repo for KnowMe. Set up a Supabase project (free tier) — this will be your database and auth layer.
Week 1	Domain & hosting	Purchase your domain (knowme.app or similar). Create a Vercel account and connect it to your GitHub repo. Every push to GitHub will auto-deploy.
Week 2	Learn React basics	Work through the official React docs and one free tutorial (Scrimba or freeCodeCamp). Your prototype is already in React — this fills in the gaps so you can modify it confidently.
Week 2	Supabase schema	Design your database tables: users, questions, votes, replies. Supabase has a visual editor — no SQL required to start. Claude can help you design the schema.
Week 3	Authentication	Integrate Supabase Auth for email/password sign-in. Add Twilio for SMS verification (create a free trial account). Connect the onboarding flow from your prototype to real auth.
Week 3	Convert prototype	Move the existing KnowMe prototype from a static widget into a real React app connected to Supabase. Questions, votes, and replies should read/write to the database.

Week 4	Private beta deploy	Deploy a private version to Vercel. Share the link with 3–5 trusted people (friends, family). Gather feedback on bugs and UX. Fix the top issues.
Week 4	Apple/Google sign-in	Add Sign in with Apple and Sign in with Google via Supabase Auth — both are built-in providers and take about a day to configure.

Phase 2 — Polish & Content (Days 31–60)

Goal: make the product feel finished and build a content library of great questions.

Week 5	Question bank	Write 50–100 high-quality questions across your categories (daily, deep, personal, reflective). These seed the app and set the tone. Quality matters more than quantity.
Week 5	AI question generation	Hook up the Anthropic API to generate new questions and "make up my mind" articles automatically. This removes the manual content burden as you scale.
Week 6	Mobile responsiveness	Test and refine the app on real mobile browsers (iOS Safari, Android Chrome). Most of your users will be on phones. Fix any layout issues.
Week 6	Notifications	Add basic email notifications when someone replies to your answer. Use Resend or Postmark (both have generous free tiers). Notifications drive return visits.
Week 7	Profile pages	Build out full user profile pages showing answer history, vote badges, and a bio. Profiles give users a reason to come back and build identity in the community.
Week 7	Moderation basics	Add a report button on replies. Build a simple admin view so you can see flagged content and remove it. You are the moderator at this stage.
Week 8	Performance & bugs	Load test with a tool like k6 (free). Fix slow queries in Supabase. Review the app end-to-end as a new user and eliminate any friction or confusion.
Week 8	App Store prep	Create your Apple Developer and Google Play accounts. Prepare screenshots, app description, and privacy policy. A privacy policy is required — use a generator like Termly.

Phase 3 — Launch (Days 61–90)

Goal: get 50–100 real, engaged users and validate the core experience.

Week 9	Soft launch	Open signups to a small invite list — 20–30 people you know personally. Observe how they use the app. Watch for drop-off points in onboarding.
Week 9	App Store submission	Submit to Apple App Store and Google Play. Apple review takes 1–3 days. Address any rejection feedback promptly. Having a web version as backup is important.
Week 10	Community seeding	Post in relevant communities: Reddit (r/selfimprovement, r/socialskills), Product Hunt, Indie Hackers, Twitter/X. Be genuine — explain what you're building and why.
Week 10	Feedback loops	Add a simple in-app feedback button. Personally message your first 50 users and ask what they love and what's missing. This feedback is gold.
Week 11	Retention focus	Analyze which questions get the most engagement. Double down on that content. Set up a daily question cadence so users have a reason to return every day.
Week 11	Referral mechanic	Add a simple "invite a friend" feature. People are most likely to share KnowMe right after answering a question that resonated with them — put the share prompt there.
Week 12	Review & plan	Assess where you are: How many users? How many return daily? What's working? Use this data to decide your next 90 days — whether that's fundraising, a co-founder search, or continued organic growth.

Recommended Tech Stack

Layer	Tool	Cost	Why
Frontend	React + Vite	Free	Already used in your prototype
Hosting	Vercel	Free tier	Instant deploys from GitHub
Database	Supabase	Free tier	Postgres + auth + real-time built in
Auth / SMS	Supabase Auth + Twilio	\$0–30/mo	Phone, Apple, Google sign-in
AI Features	Anthropic API	Pay per use	Question generation, articles
Email	Resend	Free tier	Notifications and transactional email
Analytics	Posthog	Free tier	User behavior, funnel analysis
Domain	Namecheap	\$10–15/yr	Simple, affordable registrar

Budget Breakdown

One-Time Costs

Item	Cost	Notes
Domain name	~\$15	knowme.app or similar via Namecheap
Apple Developer Account	\$99/yr	Required for App Store distribution
Google Play Account	\$25	One-time fee, no annual renewal
Privacy policy / terms	\$0–50	Use Termly free tier or basic paid plan

Monthly Running Costs (Early Stage)

Item	Cost	Notes
Vercel hosting	\$0–20	Free tier handles early traffic easily
Supabase database	\$0–25	Free tier up to 500MB and 50,000 MAU
Twilio SMS verification	\$10–50	Approx \$0.01 per SMS sent
Anthropic API (AI features)	\$5–30	Depends on question generation volume
Resend email	\$0	Free up to 3,000 emails/month
Posthog analytics	\$0	Free up to 1 million events/month

Estimated Total — First 90 Days

\$300 – \$800

Success Metrics at Day 90

**50–100 registered
users**

30%+ day-7 retention

**3+ replies per
question**

**1 live app store
listing**

Key Learning Resources

- **React:** react.dev (official docs), Scrimba React course (free)

- **Supabase:** supabase.com/docs — excellent step-by-step guides
- **Tailwind CSS:** tailwindcss.com/docs — styling without writing much CSS
- **Twilio SMS:** twilio.com/docs/verify — the Verify API is purpose-built for phone auth
- **Vercel deployment:** vercel.com/docs — deploy in under 5 minutes
- **Claude:** use it to write, explain, and debug code at every step

This roadmap was prepared as part of a product strategy session. Timelines are estimates and may vary based on prior experience and available hours per week. The budget assumes a solo founder doing most development work personally.
